

Before it goes to the client

Four checks for anything AI helped you make. Most take a few minutes.

RULE OF THUMB
If you can't open the source yourself, it doesn't go on the slide.

1 Should AI do this?

If this is wrong, who catches it, and when?

- **Let AI draft** when the stakes are low and you can check the result: outlines, first passes, reformatting.
- **Keep it human** when it needs judgment or someone accountable: recommendations, client advice, anything you'll defend in the room.
- Don't rule AI out by default. An approved tool can save hours on safe tasks.

2 Protect the client

Would the client be comfortable seeing where their data went?

- Use **only firm-approved AI tools** for client work. Free public tools are off limits.
- Share **only the data the task needs**.
- Take out **names, account numbers** and anything else that identifies a person or account.
- Not sure a tool is approved? Ask before you upload, not after.

3 Check for the three errors

What would a careful reader catch?

- **Made-up facts.** Open every source. Asking the AI "Are you sure?" isn't checking; it can't check itself.
- **Bias.** Look for one-sided framing or assumptions about people, markets or options.
- **What's missing.** Summaries leave things out. Skim the originals for anything skipped.

4 Own it

Could you explain every line if the client asked?

- **Rewrite** AI output in your own words.
- **Cite real sources** you've opened yourself, in the footnote.
- **Unsure? Ask a colleague** before it goes out. Checking the sources first saves their time.

When this happens, do this

SITUATION	WHAT TO DO
AI gives you a number and names a source	Find and open that source. If it doesn't exist, use a real one and cite it.
You want AI to analyze a client file	Use the approved tool and remove identifying columns first.
AI summarizes several articles for you	Skim each original for risks or facts the summary skipped.
